

## Title

Baseline characteristics of adults enrolled in an evaluation of guided behavioural activation: an analysis of longer-term use

## Abstract

This baseline report describes 337 adults enrolled to assess guided behavioural activation for major depressive disorder. Participants were recruited through primary-care and specialist clinics; baseline severity, medication use, functional status, and social factors were recorded before treatment allocation. The cohort was broadly representative of the intended clinical population, although referral patterns may affect external validity. The investigators reported uncertainty intervals rather than relying on a single summary estimate. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: CBT + strength and balance exercise.
