

Title

Adverse events and treatment exposure during home strength and balance exercise for postoperative joint replacement recovery: a participant-level secondary analysis

Abstract

Safety data from the evaluation of home strength and balance exercise for postoperative joint replacement recovery were reviewed across 374 participants. Most events were mild or unrelated to treatment; serious events were uncommon and balanced between groups. Exposure, discontinuation, and protocol deviations are reported to support interpretation of the clinical outcome findings. The study team documented variation in delivery intensity across participating sites. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
