

Title

Design And Implementation Protocol for brief sleep restriction therapy in insomnia in older adults: a patient-centred outcomes report

Abstract

an outpatient research network tested brief sleep restriction therapy for adults with insomnia in older adults. Participants will be recruited within a pragmatic network of hospital and community providers; the planned sample is 448 and sleep efficiency is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Generalisability may be reduced because participating sites had established research infrastructure. The report discusses how missing observations may affect interpretation of the final estimates. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
