

Title

Comparative effectiveness of brief sleep restriction therapy for insomnia in older adults: results from linked clinical records

Abstract

Researchers evaluated brief sleep restriction therapy against standard care in 448 adults with insomnia in older adults. The primary analysis indicated a modest improvement for sleep efficiency, while treatment exposure and adverse events were broadly comparable between groups. The study was not powered to detect uncommon adverse events. The findings are intended to inform evidence synthesis rather than replace confirmatory trials. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
