

Title

Methods Paper Describing The Trial Framework for pacing and energy conservation coaching in post-viral fatigue syndrome: a multisite effectiveness study

Abstract

an outpatient research network tested pacing and energy conservation coaching for adults with post-viral fatigue syndrome. Participants will be recruited across community services and outpatient practices; the planned sample is 485 and physical function is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Interpretation is limited by attrition and the pragmatic delivery setting. Recruitment pathways and treatment fidelity were examined to support interpretation of the estimates. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
