

Title

Design And Implementation Protocol for home blood pressure monitoring in hypertension: a prespecified analysis of outcomes

Abstract

the trial team compared home blood pressure monitoring for adults with hypertension. Participants will be recruited using electronic records and clinician referral; the planned sample is 102 and glycaemic control is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The study was not powered to detect uncommon adverse events. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
