

Title

A pragmatic evaluation of home blood pressure monitoring for hypertension: a health-system perspective

Abstract

Researchers evaluated home blood pressure monitoring against standard care in 102 adults with hypertension. Between-group estimates favoured the intervention for glycaemic control, while treatment exposure and adverse events were broadly comparable between groups. Generalisability may be reduced because participating sites had established research infrastructure. Patient retention varied by site, with the largest losses occurring before the final assessment. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
