

Title

Secondary analysis of glycaemic control after home blood pressure monitoring for hypertension: a follow-up analysis of care pathways

Abstract

A prespecified secondary analysis examined variation in glycaemic control after home blood pressure monitoring among adults with hypertension. Effects were explored by baseline severity, age, adherence, and recruitment setting. The pattern was directionally consistent with the primary analysis, but subgroup estimates were imprecise. Results were interpreted alongside baseline severity, treatment exposure, and concurrent care. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
