

Title

Protocol And Statistical Analysis Plan for home pulmonary rehabilitation in chronic obstructive pulmonary disease: an outpatient outcomes study

Abstract

an outpatient research network tested home pulmonary rehabilitation for adults with chronic obstructive pulmonary disease. Participants will be recruited at urban and regional clinical sites; the planned sample is 139 and exercise tolerance is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Generalisability may be reduced because participating sites had established research infrastructure. The investigators reported uncertainty intervals rather than relying on a single summary estimate. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
