

Title

Comparative effectiveness of home pulmonary rehabilitation for chronic obstructive pulmonary disease: a real-world assessment of delivery

Abstract

An outpatient research network tested home pulmonary rehabilitation against standard care in 139 adults with chronic obstructive pulmonary disease. The observed difference was clinically interpretable for exercise tolerance, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. Service capacity and local referral practices influenced the observed pattern of care. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
