

Title

Secondary analysis of exercise tolerance after home pulmonary rehabilitation for chronic obstructive pulmonary disease: an analysis of treatment persistence

Abstract

A prespecified secondary analysis examined variation in exercise tolerance after home pulmonary rehabilitation among adults with chronic obstructive pulmonary disease. Effects were explored by baseline severity, age, adherence, and recruitment setting. The pattern was directionally consistent with the primary analysis, but subgroup estimates were imprecise. The analysis was designed to reflect the decisions faced by clinicians in routine practice. The authors described uncertainty around maintenance of the observed pattern beyond follow-up. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
