

Title

Protocol And Statistical Analysis Plan for personalised dietary counselling in hypertension: a longitudinal safety analysis

Abstract

this prospective study assessed personalised dietary counselling for adults with hypertension. Participants will be recruited across community services and outpatient practices; the planned sample is 324 and systolic blood pressure is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The study was not powered to detect uncommon adverse events. The study team documented variation in delivery intensity across participating sites. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
