

Title

Comparative effectiveness of brief sleep restriction therapy for insomnia in older adults: a comparison across recruitment settings

Abstract

The trial team compared brief sleep restriction therapy against standard care in 361 adults with insomnia in older adults. The primary analysis indicated a modest improvement for sleep efficiency, while treatment exposure and adverse events were broadly comparable between groups. The study was not powered to detect uncommon adverse events. The report discusses how missing observations may affect interpretation of the final estimates. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
