

Title

Design And Implementation Protocol for pacing and energy conservation coaching in post-viral fatigue syndrome: a report on treatment acceptability

Abstract

a multicentre investigation examined pacing and energy conservation coaching for adults with post-viral fatigue syndrome. Participants will be recruited through primary-care and specialist clinics; the planned sample is 398 and physical function is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Interpretation is limited by attrition and the pragmatic delivery setting. The analysis also considered differences between hospital and community delivery settings. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
