

Title

Secondary analysis of physical function after pacing and energy conservation coaching for post-viral fatigue syndrome: a study of care access and outcomes

Abstract

A prespecified secondary analysis examined variation in physical function after pacing and energy conservation coaching among adults with post-viral fatigue syndrome. Effects were explored by baseline severity, age, adherence, and recruitment setting. The pattern was directionally consistent with the primary analysis, but subgroup estimates were imprecise. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
