

Title

Prospective Study Protocol for home blood pressure monitoring in hypertension: an analysis of longer-term use

Abstract

this prospective study assessed home blood pressure monitoring for adults with hypertension. Participants will be recruited using electronic records and clinician referral; the planned sample is 435 and glycaemic control is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The findings should be considered alongside short follow-up and incomplete adherence data. Patient retention varied by site, with the largest losses occurring before the final assessment. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
