

Title

An economic evaluation of home pulmonary rehabilitation for chronic obstructive pulmonary disease: a pragmatic service evaluation

Abstract

A within-trial economic evaluation estimated healthcare use and costs associated with home pulmonary rehabilitation for chronic obstructive pulmonary disease. Resource use, service contacts, medication changes, and quality-adjusted survival were compared with standard care. Results were sensitive to assumptions about intervention delivery and longer-term maintenance. The economic model varied staff time, service intensity, and the assumed duration of treatment benefit. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: CBT + educational material.
