

Title

Adverse events and treatment exposure during a graded activity programme for chronic low back pain: a community-based assessment

Abstract

Safety data from the evaluation of a graded activity programme for chronic low back pain were reviewed across 89 participants. Most events were mild or unrelated to treatment; serious events were uncommon and balanced between groups. Exposure, discontinuation, and protocol deviations are reported to support interpretation of the clinical outcome findings. The investigators noted that the observed association should not be interpreted as proof of causation. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: CBT + strength and balance exercise.
