

Title

Design And Implementation Protocol for structured medication review in heart failure with preserved ejection fraction: a patient-centred outcomes report

Abstract

researchers evaluated structured medication review for adults with heart failure with preserved ejection fraction. Participants will be recruited at urban and regional clinical sites; the planned sample is 126 and symptom burden is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The findings should be considered alongside short follow-up and incomplete adherence data. The study team documented variation in delivery intensity across participating sites. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
