

Title

Efficacy and safety of structured medication review for heart failure with preserved ejection fraction: results from linked clinical records

Abstract

A multicentre investigation examined structured medication review against standard care in 126 adults with heart failure with preserved ejection fraction. The observed difference was clinically interpretable for symptom burden, while treatment exposure and adverse events were broadly comparable between groups. The study was not powered to detect uncommon adverse events. Results were broadly stable after adjustment for age, baseline severity, and prior treatment. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
