

Title

Randomized trial of brief sleep restriction therapy for insomnia in older adults: a follow-up analysis of care pathways

Abstract

This prospective study assessed brief sleep restriction therapy against standard care in 274 adults with insomnia in older adults. The observed difference was clinically interpretable for sleep efficiency, while treatment exposure and adverse events were broadly comparable between groups. The study was not powered to detect uncommon adverse events. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
