

Title

Methods Paper Describing The Trial Framework for pacing and energy conservation coaching in post-viral fatigue syndrome: an outpatient outcomes study

Abstract

investigators explored pacing and energy conservation coaching for adults with post-viral fatigue syndrome. Participants will be recruited through primary-care and specialist clinics; the planned sample is 311 and physical function is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Interpretation is limited by attrition and the pragmatic delivery setting. Patient retention varied by site, with the largest losses occurring before the final assessment. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
