

Title

Implementing home blood pressure monitoring in routine care for hypertension: a real-world assessment of delivery

Abstract

This implementation report describes delivery of home blood pressure monitoring for people with hypertension across routine services. Staff training, referral pathways, fidelity, reach, and participant engagement were monitored alongside glycaemic control. Adoption was feasible, although local staffing and infrastructure shaped delivery. Results were interpreted alongside baseline severity, treatment exposure, and concurrent care. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: CBT + educational material.
