

Title

Prospective Study Protocol for a graded activity programme in chronic low back pain: a report from regional services

Abstract

researchers evaluated a graded activity programme for adults with chronic low back pain. Participants will be recruited across community services and outpatient practices; the planned sample is 422 and pain-related function is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Generalisability may be reduced because participating sites had established research infrastructure. Service capacity and local referral practices influenced the observed pattern of care. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
