

Title

Comparative effectiveness of a graded activity programme for chronic low back pain: a clinical epidemiology analysis

Abstract

Researchers evaluated a graded activity programme against standard care in 422 adults with chronic low back pain. The primary analysis indicated a modest improvement for pain-related function, while treatment exposure and adverse events were broadly comparable between groups. Generalisability may be reduced because participating sites had established research infrastructure. The analysis was designed to reflect the decisions faced by clinicians in routine practice. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
