

Title

Comparative effectiveness of structured medication review for heart failure with preserved ejection fraction: a longitudinal safety analysis

Abstract

The trial team compared structured medication review against standard care in 459 adults with heart failure with preserved ejection fraction. The observed difference was clinically interpretable for symptom burden, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. Differences in adherence were more pronounced among participants recruited through community services. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
