

Title

Protocol And Statistical Analysis Plan for guided behavioural activation in major depressive disorder: a study of implementation fidelity

Abstract

an outpatient research network tested guided behavioural activation for adults with major depressive disorder. Participants will be recruited within a pragmatic network of hospital and community providers; the planned sample is 496 and depressive symptom severity is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Interpretation is limited by attrition and the pragmatic delivery setting. The investigators noted that the observed association should not be interpreted as proof of causation. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
