

Title

Adverse events and treatment exposure during guided behavioural activation for major depressive disorder: a report on treatment acceptability

Abstract

Safety data from the evaluation of guided behavioural activation for major depressive disorder were reviewed across 496 participants. Most events were mild or unrelated to treatment; serious events were uncommon and balanced between groups. Exposure, discontinuation, and protocol deviations are reported to support interpretation of the clinical outcome findings. The report discusses how missing observations may affect interpretation of the final estimates. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
