

Title

Baseline characteristics of adults enrolled in an evaluation of brief sleep restriction therapy: an analysis of longer-term use

Abstract

This baseline report describes 187 adults enrolled to assess brief sleep restriction therapy for insomnia in older adults. Participants were recruited at urban and regional clinical sites; baseline severity, medication use, functional status, and social factors were recorded before treatment allocation. The cohort was broadly representative of the intended clinical population, although referral patterns may affect external validity. Recruitment pathways and treatment fidelity were examined to support interpretation of the estimates. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
