

Title

A pragmatic evaluation of brief sleep restriction therapy for insomnia in older adults: a report on clinical decision-making

Abstract

An outpatient research network tested brief sleep restriction therapy against standard care in 187 adults with insomnia in older adults. The primary analysis indicated a modest improvement for sleep efficiency, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
