

Title

Patient-reported experience after brief sleep restriction therapy for insomnia in older adults: a multisite patient follow-up

Abstract

This report examined patient-reported experience and quality of life after brief sleep restriction therapy for insomnia in older adults. Participants described changes in daily activity, confidence, symptom control, and care burden. Improvements in sleep efficiency were accompanied by variable satisfaction with access and treatment workload. Patient retention varied by site, with the largest losses occurring before the final assessment. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
