

Title

Implementing brief sleep restriction therapy in routine care for insomnia in older adults: a pragmatic service evaluation

Abstract

This implementation report describes delivery of brief sleep restriction therapy for people with insomnia in older adults across routine services. Staff training, referral pathways, fidelity, reach, and participant engagement were monitored alongside sleep efficiency. Adoption was feasible, although local staffing and infrastructure shaped delivery. The investigators reported uncertainty intervals rather than relying on a single summary estimate. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
