

Title

Implementing home pulmonary rehabilitation in routine care for chronic obstructive pulmonary disease: a community-based assessment

Abstract

This implementation report describes delivery of home pulmonary rehabilitation for people with chronic obstructive pulmonary disease across routine services. Staff training, referral pathways, fidelity, reach, and participant engagement were monitored alongside exercise tolerance. Adoption was feasible, although local staffing and infrastructure shaped delivery. The report distinguishes protocol-defined outcomes from exploratory measures collected during follow-up. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
