

Title

Protocol And Statistical Analysis Plan for structured medication review in heart failure with preserved ejection fraction: results from linked clinical records

Abstract

investigators explored structured medication review for adults with heart failure with preserved ejection fraction. Participants will be recruited within a pragmatic network of hospital and community providers; the planned sample is 372 and symptom burden is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The study was not powered to detect uncommon adverse events. The investigators noted that the observed association should not be interpreted as proof of causation. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
