

Title

Comparative effectiveness of structured medication review for heart failure with preserved ejection fraction: a mixed-methods implementation report

Abstract

This prospective study assessed structured medication review against standard care in 372 adults with heart failure with preserved ejection fraction. Results were consistent with the prespecified hypothesis for symptom burden, while treatment exposure and adverse events were broadly comparable between groups. The study was not powered to detect uncommon adverse events. The study team documented variation in delivery intensity across participating sites. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
