

Title

Protocol And Statistical Analysis Plan for guided behavioural activation in major depressive disorder: a follow-up analysis of care pathways

Abstract

this prospective study assessed guided behavioural activation for adults with major depressive disorder. Participants will be recruited within a pragmatic network of hospital and community providers; the planned sample is 409 and depressive symptom severity is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The findings should be considered alongside short follow-up and incomplete adherence data. The analysis also considered differences between hospital and community delivery settings. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
