

Title

Patient-reported experience after guided behavioural activation for major depressive disorder: a report from regional services

Abstract

This report examined patient-reported experience and quality of life after guided behavioural activation for major depressive disorder. Participants described changes in daily activity, confidence, symptom control, and care burden. Improvements in depressive symptom severity were accompanied by variable satisfaction with access and treatment workload. Results were interpreted alongside baseline severity, treatment exposure, and concurrent care. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
