

Title

Registered Protocol For The Planned Evaluation for personalised dietary counselling in hypertension: a longitudinal safety analysis

Abstract

investigators explored personalised dietary counselling for adults with hypertension. Participants will be recruited through primary-care and specialist clinics; the planned sample is 483 and systolic blood pressure is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The study was not powered to detect uncommon adverse events. A prespecified sensitivity analysis produced estimates in the same general direction. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
