

Title

Comparative effectiveness of personalised dietary counselling for hypertension: a study of implementation fidelity

Abstract

The trial team compared personalised dietary counselling against standard care in 483 adults with hypertension. Between-group estimates favoured the intervention for systolic blood pressure, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. The report distinguishes protocol-defined outcomes from exploratory measures collected during follow-up. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
