

Title

Comparative effectiveness of home blood pressure monitoring for hypertension: a study of care access and outcomes

Abstract

This prospective study assessed home blood pressure monitoring against standard care in 174 adults with hypertension. Results were consistent with the prespecified hypothesis for glycaemic control, while treatment exposure and adverse events were broadly comparable between groups. The study was not powered to detect uncommon adverse events. The report discusses how missing observations may affect interpretation of the final estimates. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
