

Title

Registered Protocol For The Planned Evaluation for home pulmonary rehabilitation in chronic obstructive pulmonary disease: an analysis of longer-term use

Abstract

the trial team compared home pulmonary rehabilitation for adults with chronic obstructive pulmonary disease. Participants will be recruited using electronic records and clinician referral; the planned sample is 211 and exercise tolerance is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The findings should be considered alongside short follow-up and incomplete adherence data. The findings are intended to inform evidence synthesis rather than replace confirmatory trials. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
