

Title

A pragmatic evaluation of home pulmonary rehabilitation for chronic obstructive pulmonary disease: a report on clinical decision-making

Abstract

Researchers evaluated home pulmonary rehabilitation against standard care in 211 adults with chronic obstructive pulmonary disease. The observed difference was clinically interpretable for exercise tolerance, while treatment exposure and adverse events were broadly comparable between groups. Generalisability may be reduced because participating sites had established research infrastructure. The analysis also considered differences between hospital and community delivery settings. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
