

Title

Comparative effectiveness of a graded activity programme for chronic low back pain: a multisite patient follow-up

Abstract

A multicentre investigation examined a graded activity programme against standard care in 248 adults with chronic low back pain. Results were consistent with the prespecified hypothesis for pain-related function, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. Recruitment pathways and treatment fidelity were examined to support interpretation of the estimates. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
