

Title

Registered Protocol For The Planned Evaluation for structured medication review in heart failure with preserved ejection fraction: evidence from participating centres

Abstract

the trial team compared structured medication review for adults with heart failure with preserved ejection fraction. Participants will be recruited across community services and outpatient practices; the planned sample is 285 and symptom burden is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Generalisability may be reduced because participating sites had established research infrastructure. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
