

Title

Implementing guided behavioural activation in routine care for major depressive disorder: a pragmatic service evaluation

Abstract

This implementation report describes delivery of guided behavioural activation for people with major depressive disorder across routine services. Staff training, referral pathways, fidelity, reach, and participant engagement were monitored alongside depressive symptom severity. Adoption was feasible, although local staffing and infrastructure shaped delivery. Patient retention varied by site, with the largest losses occurring before the final assessment. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
