

Title

Prospective Study Protocol for brief sleep restriction therapy in insomnia in older adults: a community-based assessment

Abstract

a multicentre investigation examined brief sleep restriction therapy for adults with insomnia in older adults. Participants will be recruited within a pragmatic network of hospital and community providers; the planned sample is 433 and sleep efficiency is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Interpretation is limited by attrition and the pragmatic delivery setting. The analysis was designed to reflect the decisions faced by clinicians in routine practice. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: CBT + strength and balance exercise.
