

Title

Design And Implementation Protocol for pacing and energy conservation coaching in post-viral fatigue syndrome: a patient-centred outcomes report

Abstract

an outpatient research network tested pacing and energy conservation coaching for adults with post-viral fatigue syndrome. Participants will be recruited through primary-care and specialist clinics; the planned sample is 470 and physical function is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Generalisability may be reduced because participating sites had established research infrastructure. A prespecified sensitivity analysis produced estimates in the same general direction. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
