

Title

Efficacy and safety of pacing and energy conservation coaching for post-viral fatigue syndrome: results from linked clinical records

Abstract

Investigators explored pacing and energy conservation coaching against standard care in 470 adults with post-viral fatigue syndrome. The observed difference was clinically interpretable for physical function, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. The report distinguishes protocol-defined outcomes from exploratory measures collected during follow-up. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
