

Title

Implementing pacing and energy conservation coaching in routine care for post-viral fatigue syndrome: a mixed-methods implementation report

Abstract

This implementation report describes delivery of pacing and energy conservation coaching for people with post-viral fatigue syndrome across routine services. Staff training, referral pathways, fidelity, reach, and participant engagement were monitored alongside physical function. Adoption was feasible, although local staffing and infrastructure shaped delivery. Differences in adherence were more pronounced among participants recruited through community services. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
