

Title

A pragmatic evaluation of pacing and energy conservation coaching for post-viral fatigue syndrome: a multisite effectiveness study

Abstract

This prospective study assessed pacing and energy conservation coaching against standard care in 470 adults with post-viral fatigue syndrome. The primary analysis indicated a modest improvement for physical function, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. The investigators noted that the observed association should not be interpreted as proof of causation. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
